World-Class FD Marketplace: Build Narrow, Architect Broad

Core clarification

The first product must remain a world-class FD marketplace. But it should not be architected as a narrow FD booking app. The hidden platform architecture should be a reusable multi-bank, multi-product integration infrastructure, with FD as the first product module.

1. Strategic direction

- Visible customer proposition now: a beautiful, simple, trusted FD marketplace and safe-money platform.
- Internal architecture objective: a reusable bank product marketplace infrastructure.
- Once FD integration, trust, customer journeys and bank workflows stabilise, the same infrastructure can support more products from the same banks.
- Do not build those additional products now. Only ensure the architecture does not block them later.

2. Reusable infrastructure to design from day one

Reusable layer	Needed for FD now	Useful later for
Bank partner master	Partner profile, FD product status, SLA, escalation contacts	Savings accounts, cards, loans, MSME products
Customer identity + KYC	PAN, KYC/CKYC status, bank verification, nominee	All bank products and future neo-bank journeys
Product master framework	FD rate, tenure, payout, limits, premature withdrawal	Any bank product with pricing, eligibility and terms
Application workflow engine	FD application, review, consent, status tracking	Account opening, card application, loan application
Consent + disclosure engine	FD terms, suitability note, audit record	Product-specific disclosure and compliance
Partner API / integration layer	FD data, submission, confirmation, servicing status	Reusable bank connector for multiple product APIs
Servicing + ticketing layer	FD booking issue, maturity query, renewal support	Cross-product support and grievance tracking
Analytics layer	FD funnel, conversion, drop-off, bank performance	Bank marketplace performance and partner scorecards

3. Important design rule

- The integration core can be reusable, but every new product will require its own product-specific rules, compliance flow, customer journey, risk controls and servicing model.
- FD is simpler. Savings accounts, credit cards, MSME loans, payments and investments will each need separate business logic and regulatory treatment.
- Build the core platform broad; keep the current customer product narrow and excellent.

4. Immediate instruction for the PoC

Build / preserve now	Do not build now
• World-class FD customer journey	• Credit cards, loans or payments as live modules
• Multi-bank FD product master	• Generic financial supermarket screens
• Configurable bank partner master	• Hardcoded FD-only data structures
• Reusable application workflow	• Complex bank-like account infrastructure
• Consent, disclosure and audit trail	• Overbuilt admin features beyond PoC need
• Bank-wise and product-wise API abstraction	• Uncontrolled AI advice or opaque recommendations
• Dashboard, maturity and servicing foundation	• Anything that weakens simplicity and premium design

One-line architecture message

Build the FD marketplace as the first product module on top of a reusable bank-product integration platform. The first release must look narrow, premium and world-class to customers, while the architecture remains ready for multi-bank and multi-product expansion.
