FD Platform PoC - Rule-Based Recommendation Use Cases

Brief note for Founding Tech Team | Prototype Demonstration Scope

Objective: For the PoC, demonstrate rule-based FD recommendations through three clear depositor scenarios. The goal is to show a premium, recommendation-led FD experience - not merely a rate comparison marketplace. AI-led recommendations can be moved to the MVP stage after the journey and logic are validated.

Important working assumption: Rates and bank names below are sample inputs for prototype demonstration only. Before any production use, rates, eligibility, DICGC treatment, product terms and bank-specific conditions must be verified from official / partner-bank sources.

Use Case 1 - Simple Senior Citizen FD Investment

Scenario: A senior citizen depositor has Rs. 5,00,000 to invest and needs the money only after 2 years.

Field	Input
Investment amount	Rs. 5,00,000
Goal	Capital protection and fixed return
Time horizon	2 years / 730 days
Customer type	Senior citizen
Liquidity need	Not required before maturity
Product scope	Bank FD

Recommendation

Bank	Tenor	Base rate	Senior citizen benefit	Effective rate	Allocation
Axis Bank	2 years / 730 days	7.00%	0.50%	7.50%	Rs. 5,00,000

Customer-facing explanation

Since you need the money only after 2 years, we recommend a 730-day FD. Based on the sample rates, Axis Bank offers the best senior citizen rate for this period. This matches your time horizon and gives a predictable return.

Safety note to display: Deposit insurance and product terms are subject to applicable rules and bank-specific conditions. The platform should display the coverage note clearly at the time of recommendation and booking.

Use Case 2 - Multi-Goal FD Allocation

Scenario: A depositor has Rs. 25,00,000 with three different goals: emergency fund, children's education and retirement.

Goal	Amount	Timeline	Intent
Emergency fund	Rs. 5,00,000	91 days	Short-term liquidity
Children's education	Rs. 10,00,000	3 years	Goal matching with diversification
Retirement	Rs. 10,00,000	10 years	Long-term fixed return

Recommendation summary

Goal	Bank	Tenor	Rate	Allocation	Reason
Emergency fund	Equitas Small Finance Bank	91 days	6.85%	Rs. 5,00,000	Short tenor to preserve emergency liquidity; highest sample rate for the tenor.
Children's education	AU Small Finance Bank	3 years	7.20%	Rs. 5,00,000	Highest sample rate, but capped to reduce concentration.
Children's education	ICICI Bank	3 years	7.00%	Rs. 5,00,000	Next suitable large-bank option to balance return and risk.
Retirement	SBI	10 years	7.85%	Rs. 10,00,000	Long-tenor allocation with a large established bank.

Customer-facing explanation

Your Rs. 25 lakh has been divided according to your goals. Emergency money is kept short term. Education money is matched to the 3-year timeline and split across two banks to reduce concentration. Retirement money is placed in a long-tenor FD with SBI because the goal is 10 years away.

Safety note to display: Although Equitas and AU are Small Finance Banks, the recommendation should clearly show the applicable deposit-insurance note and concentration logic. The live product must verify current eligibility, rates and terms before showing the recommendation.

Use Case 3 - Target Maturity Amount in 5 Years

Scenario: A depositor has Rs. 20,00,000 and wants it to grow to approximately Rs. 27,00,000 in 5 years through FD investments.

Field	Input
Investment amount	Rs. 20,00,000

Target amount	Rs. 27,00,000
Time horizon	5 years
Goal	Growth through FD
Risk preference	Moderate, with diversification
Product scope	Bank FD

Recommendation

Bank	Tenor	Rate	Allocation	Reason
Equitas Small Finance Bank	5 years	7.50%	Rs. 5,00,000	High sample rate; allocation capped for diversification.
AU Small Finance Bank	5 years	7.50%	Rs. 5,00,000	High sample rate; allocation capped for diversification.
Suryoday Small Finance Bank	5 years	7.50%	Rs. 5,00,000	High sample rate; allocation capped for diversification.
IDFC FIRST Bank	5 years	7.20%	Rs. 5,00,000	Next highest suitable sample rate for the remaining amount.

Customer-facing explanation

To target growth over 5 years, we recommend diversifying the Rs. 20 lakh across four banks. This allows you to capture higher sample rates from Small Finance Banks while avoiding concentration in a single institution. The remaining amount is placed with IDFC FIRST Bank as the next suitable high-rate option.

Target check to display: The system should calculate whether the suggested FD structure is likely to reach the Rs. 27 lakh target based on the selected compounding frequency. If the target is not fully met, the platform should show a gap message and suggest increasing the amount, extending the tenure, or considering a different product mix in the MVP stage.

Product principle for PoC: The prototype should communicate that the platform is recommendation-led and goal-led. It should help the depositor understand why a bank, tenor and allocation are suitable, rather than simply showing the highest rate.
